## Section 11. Toxicological Information

### 11.1 Information on toxicological effects

#### Acute toxicity

Acute toxicity (Oral)

[Product data]

LD<sub>50</sub> > 5,000mg/kg (Rat)

#### Germ cell mutagenicity

[Data for components of the product]

Ames test :Negative

#### Carcinogenicity

[Data for components of the product]

(Carbon black)

The IARC classified carbon black as a Group 2B carcinogen(possible human carcinogen).

But carcinogenicity was not observed with toner containing carbon black in chronic rat

inhalation study.

(Titanium dioxide)

The IARC reevaluated titanium dioxide as a Group 2B carcinogen (possible human carcinogen).

In animal chronic inhalation studies, carcinogenicity was observed in only specific rats.

This is attributed to “lung overloading”, a generic response to excessive amounts of any dust retained in the lungs for a prolonged interval. Epidemiological study to date has not revealed any evidence of the relation between work exposure of titanium dioxide and respiratory diseases.

Reproductive toxicity data is not available.

Specific target organ toxicity (STOT)

STOT-single exposure

[Data for components of the product]

Chronic Effects

In a study in rats by chronic inhalation exposure to a typical toner, a mild to moderate degree of lung fibrosis was observed in 92 % of the rats in the high concentration (16 mg/m<sup>3</sup>) exposure group, and a minimal to mild degree of fibrosis was noted in 22% of the animals in the middle (4mg/m<sup>3</sup>) exposure group. These findings are attributed to “lung overloading”, a general response to excessive amounts of any dust retained in the lungs for a prolonged period.

Aspiration hazard data is not available.
